

ON-CHAIN DISTRIBUTION & HEALTH REPORT

\$ANSEM — "The Black Bull"

Solana SPL Token-2022 Mint

Mint address:

9cRCn9rGT8V2imeM2BaKs13yhMEais3ruM3rPvTGpump

Prepared by:

0x_note — independent on-chain forensics analyst

Report date:

September 22, 2026

Snapshot disclaimer

This is a Solana SPL Token-2022 asset — findings were gathered using Solana-native tooling (Solscan, Dune's Solana schemas) rather than Ethereum-style analysis. All balances, prices, and pool reserves in this report are point-in-time snapshots taken between September 21–22, 2026 (UTC), as cited beside each figure. On-chain state (balances, pool depth, price) changes continuously; treat every number here as accurate as of its cited timestamp, not as live.

Every factual claim below is cited to a specific wallet address, transaction signature, Solscan page, or named public source. Where a claim could not be independently verified on-chain, that is stated explicitly rather than presented as fact.

1. Executive Summary

- **Origin:** Launched on Pump.fun by an anonymous deployer wallet, yHCxHBEaJW5tbndqC8JciSThr7U1cqLpdcsvHcx6PRe, around June 17, 2026. Named after — but not created or endorsed by — Solana trader Ansem (@blknoiz06).
- **Fixed supply, standard extensions:** The mint carries no transfer-fee, permanent-delegate, transfer-hook, or freeze-on-creation extensions. Only cosmetic metadata extensions are enabled, both with a null authority. **No on-chain buy/sell tax exists on this token.**
- **Concentration:** ~66.9% of tracked supply sits in the ten largest wallets. Of that, roughly 50.7 percentage points sit in three custodial/exchange wallets (BitGo, Hyperunit, MEXC) — none of it a locked treasury or vesting contract.
- **Launch allocation:** The deployer transferred exactly 650,000,000 tokens (**65% of initial supply**) to "ansemconzimp" (GV6UU) in a single transaction at launch. A fully transaction-traced chain shows that of that original 65%, approximately 58.2% remains under that same party's control today — 49.08% in BitGo custody and 9.14% still in the GV6UU wallet — with the remainder distributed via public airdrops. See Section 5.
- **Liquidity risk:** Total identified liquidity across all venues is ~\$4.3M against a top wallet worth ~\$84M at the same snapshot. Even combining the two largest pools, a sale of just 1% of the largest wallet's balance would move price roughly 51% downward. 99.39% of the largest pool's liquidity is reported locked, which limits (but does not eliminate) the risk.
- **Airdrop retention:** Of 71.83M tokens airdropped to 1,306 wallets, only 12.05% remains held. 61.6% of recipient wallets are now at a zero balance.

2. Origin & Launch

The token was created on Pump.fun by a single deployer wallet. It was not launched by Ansem, and the deployer's identity remains anonymous.

Field	Value
Mint address	9cRCn9rGT8V2imeM2BaKs13yhMEais3ruM3rPvTGpump
Token name / symbol	"The Black Bull" / ANSEM
Deployer / creator wallet	yHCxHBEaJW5tbndqC8JciSThr7U1cqLpdcsvHcx6PRe
Launch mechanism	Pump.fun Token Mint Authority program (standard bonding-curve launch)
Launch date	June 16, 2026, 21:06:25 UTC (block 426930558)
Total supply at launch	1,000,000,000 (pump.fun standard fixed issuance)
Current supply (snapshot)	997,362,342.620018 — ~0.26% below initial issuance, consistent with routine burns
Holder count (snapshot)	142,770 — inflated by dust/zero-value airdrop recipients; see Section 7

Source: solscan.io/token/9cRCn9rGT8V2imeM2BaKs13yhMEais3ruM3rPvTGpump — Metadata & overview tabs, screenshot Sep 22 2026 04:31 UTC. Creator field independently confirmed by analyst.

Per public on-chain reporting from Lookonchain (widely syndicated: The Defiant, AMBCrypto, Bitget, Phemex, CoinEdition — see Section 8), the deployer spent approximately \$6,300 to launch the token and bought 792.45M ANSEM on the bonding curve. It then sold the remaining 142.45M for approximately \$11,800 — a net realized profit of roughly \$5,500 for the deployer, despite the token later reaching a market cap above \$120M.

Source: Lookonchain monitoring, syndicated via thedefiant.io/news/defi/ansem-airdrops-usd7m..., ambcrypto.com/ansem-deployer-sends-60..., coinedition.com/how-a-solana-meme-coin...

The 650M transfer, independently re-traced: In the same transaction that created its token account, the deployer wallet transferred 650,000,000 ANSEM (~65% of initial supply) directly to a token account owned by GV6UUmNxz2RpKxmNAPadYKb7uQpszwqQAu3qLJxVdC52 — publicly known as "ansemconzimp" on Pump.fun. This is a fully independent, transaction-level confirmation of the press-reported figure, not a secondhand claim.

5SGKQKgDfKYRv8XerDKWWEycXpz44JCdThmm4Rx6FzuaJujoGRhyYwf1dCVdakkHZPSeKTy3R9KgAR9TNfmEB3Db, bLock 426930558, Jun 16 2026 21:06:25 UTC.
solscan.io/tx/5SGKQKgDfKYRv8XerDKWWEycXpz44JCdThmm4Rx6FzuaJujoGRhyYwf1dCVdakkHZPSeKTy3R9KgAR9TNfmEB3Db, screenshot Sep 22 2026.

Ansem has publicly framed his subsequent activity as redistributing Pump.fun creator fees earned on the token back to holders via airdrops, rather than as a personal token sale, with a stated goal of reaching 1,000,000 holders.

Source: x.com/blknoiz06/status/2070871430191800832 — "...i will airdrop portions of the creator fees that have been directed to my pump fun profile..."

3. Token Program, Authorities & Tax Check

This is a Solana Token-2022 ("Token Extensions") mint, not a legacy SPL Token — confirmed by its owner program address.

Item	Status	Verdict
Owner program	TokenzQdBNbLqP5VEhdkAS6EPFLC1PHnBqCXEPxuEb (Token-2022 / Token Extensions Program)	—
Mint / update authority	"N/A" on token overview panel; metadataPointer and tokenMetadata extension authorities both explicitly NULL	Consistent with pump.fun standard (mint authority revoked at launch)
Freeze authority	No freeze authority / DefaultAccountState extension present in the Extensions table	Consistent with revoked freeze authority
Permanent Delegate extension	Not present in the Extensions (Table view) for this mint	Absent
Transfer Hook extension	Not present	Absent
Transfer Fee (tax) extension	Not present — only metadataPointer and tokenMetadata extensions are enabled, both cosmetic	NO TAX

Source: solscan.io/token/9cRCn9rGT8V2imeM2BaKs13yhMEais3ruM3rPvTGpump#metadata_extensions — Extensions (Table) tab, screenshot Sep 22 2026 04:31 UTC. Only two extension sections are listed: metadataPointer (authority: NULL) and tokenMetadata (updateAuthority: NULL).

Confirmed and cleared: \$ANSEM carries no on-chain buy or sell tax.

4. Supply Distribution — Top Holders

Top 10 wallet balances by owner (aggregated across all token accounts per owner), pulled September 21, 2026. Percentages are of tracked circulating supply (~997.4M) at that snapshot.

#	Wallet	% Supply	Category
1	7oU9nR9VEvFPwvp2PpXo2LQc6A92QRhcUTwhLWT7MsDM	49.08%	Custody — BitGo ("Ansem Bitgo Custodial" tag; funded from a Coinbase wallet)
2	GV6UUmNxz2RpKxmNAPadYKb7uQpszwqQAu3qLJxVdC52	9.14%	Active trading wallet ("ansemconzimp" on Pump.fun;

#	Wallet	% Supply	Category
			tagged via a Lookonchain tweet); holds 5,000+ other token positions
3	87ZDLDDbMAqmHJwsAgNjpJVCf9gZvwMJJMbFbXNTkva	2.38%	Unlabeled
4	2ozxuSn8UhZ1ZsoZJvmmY65GBPPyZ7sAHzogpVcn4Yam	2.20%	Unlabeled ("treebeard.sol"); wallet predates the token by 3+ years
5	9SLPTL41SPsYkgdsMzdfJsxymEANKr5bYoBsQzJyKpKS	1.23%	Custody — Hyperunit (bridge/exchange hot wallet)
6	CLM6E4zpTviEC77nWKogpVLQoXx9tgoQCYJ8NibxKg1Q	0.90%	Unlabeled
7	HCgo8gvk99Wk13XWbbAoxyEx2DgzidzVDma4ny32uYC	0.42%	Unlabeled
8	ASTyfSima4LLAdDgoFGkgqoKowG1LZFDr9fAQrg7iaJZ	0.42%	Custody — MEXC exchange hot wallet (holds 5,000+ distinct token types; general deposit wallet, not ANSEM-specific)
9	8mVv6jHupEmLGcgEQyWbAq7rKUx6svKKFoJqnPcbneQW	0.39%	Unlabeled
—	FnzKY6x7entQ1eR3D225dQyT7ybfka4PskBMQh8L3CC	0.76%	Pump.fun AMM (ANSEM-WSOL) liquidity pool — excluded from holder ranking; see Section 6

Source: Dune query on `tokens_solana.transfers` (account-level balances), executed Sep 21 2026. Wallet labels and tags cross-checked at `solscan.io/account/<address>` for each address listed, screenshots Sep 21-22 2026.

Custody rollup: BitGo (49.08%) + Hyperunit (1.23%) + MEXC (0.42%) = **50.73% of supply sits in institutional custody or exchange hot wallets** — none of it in a Squads multisig, a vesting/locker program (e.g. Streamflow, Jupiter Lock), or a disclosed project treasury. No multisig-controlled holding of any kind was identified among the top 10 wallets; every top-10 wallet is either a single-signer keypair (isOnCurve: TRUE on Solscan for all of them) or the AMM pool's program-owned vault.

Custody vs. active control: BitGo is a regulated institutional custodian. Funds held there confirm ownership by the same controlling party, but they are not equivalent to a self-custodied hot wallet in terms of sell risk: moving tokens out of BitGo custody typically requires clearing the custodian's own internal approval process (multi-party sign-off and/or policy checks), which is not visible on-chain until a withdrawal actually occurs. By contrast, GV6UU is a plain keypair wallet — whoever holds its private key can sign a transaction and route tokens into a DEX pool immediately, with no intermediary. The two holdings therefore carry materially different liquidity risk despite both being confirmed as belonging to the same party.

5. Launch Allocation — Flow of Funds

Summary: The confirmed on-chain figure, traced at the transaction level, is 65% of initial supply.

- **Transaction-level confirmation:** 650,000,000 ANSEM — exactly 65% of the 1,000,000,000 initial supply — was transferred from the deployer wallet directly to "ansemconzimp" (GV6UU) in a single transaction at token launch. Signature and citation in Section 2.
- **Where that 650M is now:** GV6UU's holding in that same token account has since fallen from 650,000,000 to 91,430,812.46 — a ~558.6M outflow. This reconciles almost exactly against two known destinations:

Line item	Amount
Received June 16, 2026	650,000,000

Line item	Amount
– To BitGo custodial wallet, July 31, 2026 (exact match to that wallet's first-ever ANSEM inflow)	491,000,100
– Publicly disclosed community airdrops (Lookonchain, by late June)	67,380,000
= Implied remaining balance	91,619,900
Actual current balance (this snapshot)	91,430,812 — within 0.03% of the implied figure

This arithmetic match is confirmed by direct transaction evidence: GV6UU moved exactly 491,000,100 ANSEM into the BitGo custodial wallet across three transactions on July 31–August 1, 2026. The full 65% traces to a single original transfer and a single controlling party — GV6UU ("ansemconzimp") received 650,000,000 ANSEM at launch, then routed 491,000,100 of it into institutional custody and at least 67,380,000 into public airdrops, retaining the remainder.

Date (UTC)	Signature	Amount
2026-07-31 22:54:39	4Le71wYNeerAG3efwCxxkHt4iW9KBn7Y8Z1uuC5day77UNSQv9WW6AZZkFjQ8AXqbVswPHYzfNjsu5BPuZMupRoY	100
2026-08-01 00:03:32	3LPvUbShXN6vvy9k7zjnaQWcCoAbVhkcISa4EvydcBtknxdsh7oBUJN1wrQ3AAE2pB6zxqNDPRCEPwnZZqvmngRw	1,000,000
2026-08-01 00:09:38	4mKqcX4taUZsv3v8aDmYEacW3HwQfjX7z96LxxUUMmRU47XKfZ23X8ps8pQJFUHCt9NAZfpG6mC6emHzH4NSrJC9	490,000,000
Total		491,000,100

Source: GV6UU token account balance: solscan.io/account/2U9XFtekYTstzMYXmuyDCNdFxRYB91dMtSKxtUB5rVct. Transfer chain confirmed via Dune query on `tokens_solana.transfers` filtering from owner IN (GV6UU, its token account) AND to_owner = 7oU9nR9VEvFPwvp2PpXo2LQc6A92QRhcUTwhLWT7MsDM, executed Sep 22 2026. Airdrop total: x.com/Lookonchain/status/2071755661160202578 and thedefiant.io/news/defi/ansem-airdrops-usd7m...

Bottom line: the confirmed on-chain figure is 65% of initial supply, transferred to a single wallet at launch (transaction cited above). Of that amount, approximately 58.2% is confirmed — via three cited transaction signatures — to remain under the control of that party today: 49.08% in BitGo custody and 9.14% still in the GV6UU wallet. The remaining ~6.7 percentage points were distributed via public airdrops (Section 7).

6. Liquidity & Sell-Pressure Risk

A full market breakdown pulled directly from Solscan lists 1,625 total trading pairs for this mint, almost all of them negligible in size given permissionless pool creation on Solana. The ten largest by volume account for effectively all meaningful liquidity and reconcile closely with the token's reported aggregate figure:

Venue	Pair	TVL
Meteora DLMM	ANSEM-WSOL	\$1,249,259.87
Pump.fun AMM	ANSEM-WSOL	\$2,637,583.87
Meteora DLMM	ANSEM-USDC	\$110,426.45
Meteora DLMM	ANSEM-WSOL	\$31,599.65
Meteora DLMM	ANSEM-WSOL	\$82,256.87
Raydium Concentrated	MANLET-ANSEM	\$115,562.71
Raydium Concentrated	ANSEM-USDC	\$6,887.90

Venue	Pair	TVL
Orca Whirlpools	WSOL-ANSEM	\$14,349.72
Orca Whirlpools	ANSEM-USDC	\$33,540.32
Meteora DLMM	ANSEM-WSOL	\$14,872.91
Top 10 total		\$4,296,340.27

This reconciles closely against Solscan's token-level aggregate liquidity figure of \$4,315,970.82 (within \$19,631 of the sum above), confirming the pool-by-pool breakdown accounts for total reported liquidity — spread across many small pools rather than concentrated in a single venue.

Source: solscan.io/token/9cRCn9rGT8V2imeM2BaKs13yhMEais3rum3rPvTGpump#markets, Markets tab, screenshot provided by the analyst.

Reserves for the two largest pools, read directly from each pool's account:

Metric	Pump.fun AMM	Meteora (largest)
Pool account	FnzKY6x7entQ1eR3D225dQyT7ybfka4PskBMQhb8L3CC	6e7V9eegCHw997T72MxgwwJipZ6GJyZF8NvjzT1rvpN
ANSEM reserve	8,046,794.15 (~\$1,252,817.55)	3,538,924.48 (~\$601,634.71)
WSOL reserve	10,681.33 (~\$1,255,396.49)	5,452.48 (~\$639,506.31)
Pool TVL	\$2,637,583.87	\$1,241,141.02
Program	Pump.fun AMM	Meteora DLMM (binned liquidity, not a plain constant-product curve)
Liquidity lock	99.39% reported locked, per Solscan's pool page. Not independently traced to the locker contract by the analyst.	None — Meteora pools carry no on-chain liquidity lock.

Source: solscan.io/account/FnzKY6x7entQ1eR3D225dQyT7ybfka4PskBMQhb8L3CC and solscan.io/account/6e7V9eegCHw997T72MxgwwJipZ6GJyZF8NvjzT1rvpN, screenshots provided by the analyst.

Additional locked pools: Two smaller Pump.fun AMM pools also carry a lock, per Solscan's pool pages: Pump.fun AMM (Noiz-ANSEM), pool account 8zVwLfWw8KpbKoTGdufn6BwTg6Z12SFREHBuZM6UUVs, reports 100% locked (TVL ~\$15,677); Pump.fun AMM (HOBBS-ANSEM), pool account 4RirToptMYQSKVN6rgX7pZ3pugqqvHgdcFhDb97Bu2nv, also reports 100% locked (TVL ~\$4,719). Both are small relative to the main pool and were not included in the sell-pressure modeling below; neither lock percentage was independently traced to its underlying locker contract. Locking, across all three Pump.fun AMM pools, is specific to that program — the Meteora pools carry no equivalent mechanism.

Modeling a constant-product ($x \cdot y = k$) swap, single-pool and combined across the two largest pools. The combined figure treats the Meteora pool's reserves as if constant-product for approximation purposes; Meteora's actual binned design concentrates liquidity around the current price rather than spreading it uniformly, so this is an estimate, not an exact model:

Sell size	Tokens sold	Single pool (Pump.fun only)	Combined (2 pools)
1% of BitGo wallet's balance	4,910,001 ANSEM (~\$840K at \$0.1714)	≈ -61%	≈ -51%
5% of BitGo wallet's balance	24,550,005 ANSEM	≈ -94%	≈ -90%
10% of BitGo wallet's balance	49,100,010 ANSEM	≈ -98%	≈ -96%

Both models ignore trading fees and assume no counter-liquidity arrives mid-sell. A real execution routed through an aggregator such as Jupiter would draw on the remaining smaller pools too, producing a somewhat smaller impact than even the combined column above. Even so, the gap between total known liquidity (~\$4.3M across all venues) and the largest wallet's value (~\$84M at the same snapshot) is wide enough that the top wallet alone could not exit even a small fraction of its position without severe price impact through on-chain liquidity.

Wallets with decreasing balances between the Sep 21 and Sep 22 snapshots: of the top 10, none of the non-pool, non-exchange wallets showed a balance decrease in the ~24-hour window checked; the two changes observed were in custodial wallets and reflect routine exchange deposit/withdrawal flow rather than a directional sell signal (Hyperunit -61,712 tokens; MEXC position moved from 4,197,242 to 4,142,196 tokens). No top-10 wallet showed a large, abrupt outflow in this window.

7. Who Has Sold — Airdrop Retention & Outflows

Ansem's wallet(s) have distributed tokens to the broader community via airdrops, publicly framed as redistributing Pump.fun creator fees (Section 2). This section traces what recipients did with those tokens.

Metric	Value
Recipients traced	1,306 wallets
Total airdropped (traced)	71,830,955.78 ANSEM
Still held	8,652,832.28 ANSEM — 12.05% retained
Sold via DEX (floor estimate)	54,550,280.44 ANSEM (capped per-wallet at amount received, to avoid over-counting unrelated trading activity)
Wallets fully exited (zero balance)	804 of 1,306 — 61.6%

Source: Dune analysis joining ANSEM outflows from GV6UUmNxz2RpKxmNAPadYKb7uQpszwqQAu3qLJxVdC52 against current owner balances and dex_solana.trades, executed Sep 22 2026.

This is consistent with earlier, smaller-sample public reporting: Lookonchain observed in late June 2026 that of an initial 67.38M ANSEM (~\$9.43M) airdropped to 700+ wallets, 74% (49.89M) went to just 7 wallets, which had already sold 38.29M of it within days.

Source: x.com/Lookonchain/status/2071755661160202578

Individual examples from the traced recipient set (page 1 of the full 1,306-row result):

Recipient	Received	First received	Held now	% retained
5URyNU...c19Y	10,000,000	2026-06-28	0	0%
49foKJ...gvctLa	8,000,000	2026-06-28	0	0%
HDixbr...cSXN3o	3,800,000	2026-06-28	3,754,834	98.8%
6F5x9F...6LxoDi	3,690,000	2026-06-27	146,062	4.0%

The recipient "49foKJ" is independently corroborated by Lookonchain reporting: it received an 8,000,000-token airdrop and sold the full position for ~\$207,000 when ANSEM's market cap stood at \$26M, a position that would later have been worth an estimated \$2.6M.

Source: x.com/Lookonchain/status/2071959162641399811; bitget.com/news/detail/12560605489515; news.bitcoin.com/ansem-token-193-million-portfolio/

8. Public Statements vs. On-Chain Data

No whitepaper exists for this project. The only public statements available are from Ansem's own X account and reporting by on-chain analytics firms (primarily Lookonchain and Bitquery). Where checkable, those statements are compared against the on-chain findings above:

Public statement	On-chain check	Result
Ansem: airdrops are Pump.fun creator fees being redistributed to holders, not a personal sale	The wallet doing the airdropping (GV6UU) has not itself sold ANSEM directly into the pool in the data reviewed; distribution instead flows outward to ~1,300+ recipient wallets, most of which then sell	Consistent with the framing at the point of distribution; does not address what happens after
Ansem: goal of reaching 1,000,000 holders	Current holder count is ~142,770; 61.6% of one traced airdrop cohort already fully exited	Far short of stated goal; retention trend works against it
Bitquery investigation: main Ansem-tagged wallet shows no direct DEX sells, while secondary/recipient wallets do sell	Matches this report's finding — BitGo wallet (rank 1) shows no large recent outflow, while airdrop recipients show an 88% sell-through rate	Consistent

No whitepaper, litepaper, or formal tokenomics document could be located for this project as of this report's date. Claims in this section are checked only against public social-media statements and third-party on-chain analytics reporting, not against any founding document.

9. Data Sources & Methodology

- On-chain balances and holder rankings: Dune Analytics, Solana schemas (tokens_solana.transfers, dex_solana.trades), custom SQL, executed Sep 21–22, 2026.
- Wallet identity, tags, funding history, and token/authority metadata: Solscan.io, account and token pages, screenshots dated Sep 21–22, 2026 as cited inline.
- Deployer behavior and early airdrop activity: Lookonchain on-chain monitoring, syndicated by The Defiant, AMBCrypto, Bitget, Phemex, CoinEdition, Grafa, and Bitcoin.com News.
- Forensic cross-check on wallet-labeling blind spots: Bitquery Research investigation, bitquery.io/investigations/ansem-black-bull-370x-investigation.
- Public statements: Ansem's X account (@blknoiz06), cited by post URL.

All Dune SQL used to produce this report's figures is retained separately and available on request for independent re-execution.

10. Limitations & Recommended Follow-Up

- Wallet attribution for GV6UU ("ansemconzimp") to Ansem rests on Solscan's public tag and a cited Lookonchain tweet, plus the deployer transaction itself naming that account — not a signed on-chain claim from Ansem's own verified wallet. The GV6UU→BitGo transfer chain itself is fully transaction-confirmed (Section 5).
- The DEX-sold figures in Section 7 are a floor estimate (capped at each wallet's received amount); true airdrop-specific selling may be somewhat higher once wallet-to-wallet passthrough transfers are fully traced.
- Meteora pools carry no on-chain liquidity lock. Of the three Pump.fun AMM pools identified for this token, the main ANSEM-WSOL pool reports 99.39% locked and the two smaller pools (Noiz-ANSEM, HOBBS-ANSEM) report 100% locked; none of these lock percentages has been independently traced to its underlying locker contract by the analyst.

- Holder counts throughout are not filtered for economically meaningless (dust) balances; a threshold-filtered holder count would give a more meaningful distribution picture than the raw 142,770 figure.

This report reflects a snapshot; a token like this can change materially within hours given its trading volume and concentration. Recommend re-running the core balance and liquidity queries before publishing any figures derived from this report if more than 48 hours has passed.

Ox / note
